

Basic Code Analysis: Complex Nested Stack Trace Diagnostics

Duration : 60 Min.

Scenario

A multithreaded transaction gateway fails under stress. Deeply examine the nested stack trace logs to find the root cause database exception.

Target File Location & Creation

File to Create/Update: `student_workspace/solution.json` **Input Resource File to Inspect:** `student_workspace/nested_stacktrace.log`

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Fill out 'root_cause_analysis.json' detailing the nested exception layer stack frames.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Open and inspect `nested_stacktrace.log` inside `student_workspace/`.
3. Open `solution.json` in `student_workspace/` and perform the required modifications.
4. Save your changes (Ctrl + S or Cmd + S).
5. Open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running `python run.py` locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Test Case	Requirement	Marks
TC1	root_cause_analysis.json exists and is valid JSON	5 Marks
TC2	Root exception correctly identified as SQLException	5 Marks

TC3	Deadlock error code (1205) correctly located in log trace	5 Marks
TC4	Class name of blocking query correctly mapped	5 Marks

Total Score: 20 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
