

Enterprise Batch Lab: Configuring Cloud Batch Retry Policies

Duration : 30 Min.

Scenario

A cloud batch job running on AWS Batch intermittently fails due to transient node startup delays. You need to configure automated retry policies.

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Define JSON configuration templates setting max retries, exponential backoffs, and timeout parameters.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Navigate to and click the specific files mentioned in the Task Objectives.
3. Make the necessary code edits in the editor.
4. Press `Ctrl + S` (Windows) or `Cmd + S` (Mac) to save your changes.
5. If you need to run commands, open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.

Validation

Once you have saved your files and are ready to submit, return to the platform dashboard and click the **"Submit Final"** button. This task is evaluated manually by the grading team.

Evaluation Rubric:

1. Defining cloud batch JSON container properties for retries: 3 marks
2. Customizing timeout metrics to prevent infinite hanging jobs: 3 marks
3. Mapping execution exit codes to retry-eligibility states: 4 marks

Total Score: 10 Marks

Important Notes

- This is a manually evaluated question.
- Ensure all logs and configurations are fully saved in your workspace folder before submitting.
