

Log Analysis: Enterprise Splunk SPL Aggregations & Transactions

Duration : 90 Min.

Scenario

An enterprise web portal experienced high latency. Write Splunk SPL queries using stats and transaction commands to calculate average response time per endpoint.

Target File Location & Creation

File to Create/Update: student_workspace/solution.json **Input Resource File to Inspect:** student_workspace/splunk_logs.txt

Task Objectives

Perform the following actions inside the student_workspace directory: - Inspect splunk_logs.txt in student_workspace/. - Edit solution.json and record the required log analytics or findings.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Open and inspect splunk_logs.txt inside student_workspace/.
3. Open solution.json in student_workspace/ and perform the required modifications.
4. Save your changes (Ctrl + S or Cmd + S).
5. Open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running python run.py locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Your performance will be evaluated based on the following test cases:

Test Case	Requirement	Marks
TC1	solution.json exists	5 Marks

TC2	Splunk 'stats avg(response_time)' aggregation query correct	5 Marks
TC3	'transaction session_id' grouping command included	5 Marks
TC4	'by endpoint' clause specified	5 Marks

Total Score: 20 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
