

Log Analysis: Enterprise Splunk SPL Aggregations & Transactions

Duration : 60 Min.

Scenario

An enterprise web portal experienced high latency. Write Splunk SPL queries using stats and transaction commands to calculate average response time per endpoint.

Task Objectives

Perform the following actions inside the student_workspace directory: - Provide SPL query strings inside 'solution.json'.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Navigate to and click the specific files mentioned in the Task Objectives.
3. Make the necessary code edits in the editor.
4. Press **Ctrl + S** (Windows) or **Cmd + S** (Mac) to save your changes.
5. If you need to run commands, open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running `python run.py` locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Your performance will be evaluated based on the following test cases:

Test Case	Requirement	Marks
TC1	solution.json exists	5 Marks
TC2	Splunk 'stats avg(response_time)' aggregation query correct	5 Marks
TC3	'transaction session_id' grouping command included	5 Marks
TC4	'by endpoint' clause specified	5 Marks

Total Score: 20 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
