

Basic Code Analysis: Repository Structure & Component Identification

Duration : 30 Min.

Scenario

A support ticket states that build config files are missing. You must identify build configuration types (Maven vs Gradle vs dotnet) based on repo files.

Target File Location & Creation

File to Create/Update: student_workspace/solution.json **Input Resource File to Inspect:** student_workspace/pom.xml

Task Objectives

Perform the following actions inside the student_workspace directory: - Complete the 'solution.json' mapping build descriptor files to their corresponding tech stack.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Open and inspect pom.xml inside student_workspace/.
3. Open solution.json in student_workspace/ and perform the required modifications.
4. Save your changes (Ctrl + S or Cmd + S).
5. Open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running python run.py locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Test Case	Requirement	Marks
TC1	solution.json exists and is valid JSON	3 Marks
TC2	pom.xml correctly mapped to Maven	4 Marks
TC3	build.gradle correctly mapped to Gradle	3 Marks

Total Score: 10 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
