

Observability Lab: Splunk Search Processing Language (SPL) Fundamentals

Duration : 30 Min.

Scenario

A security analyst needs to aggregate HTTP error counts and compute average response times per endpoint using Splunk SPL.

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Construct SPL queries utilizing `stats`, `eval`, `rex`, and `transaction` commands to analyze web server log data.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Navigate to and click the specific files mentioned in the Task Objectives.
3. Make the necessary code edits in the editor.
4. Press `Ctrl + S` (Windows) or `Cmd + S` (Mac) to save your changes.
5. If you need to run commands, open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.

Validation

Once you have saved your files and are ready to submit, return to the platform dashboard and click the **"Submit Final"** button. This task is evaluated manually by the grading team.

Evaluation Rubric:

1. Writing SPL search pipelines using `stats`, `count`, `avg`, and `top` commands: 4 marks
2. Extracting custom field attributes from log strings using regular expression (`rex`): 3 marks
3. Group-related log events into single transactions using SPL `transaction` commands: 3 marks

Total Score: 10 Marks

Important Notes

- This is a manually evaluated question.
- Ensure all logs and configurations are fully saved in your workspace folder before submitting.
