

Observability Lab: Datadog Query Language & Facet Metric Construction

Duration : 30 Min.

Scenario

DevOps engineers want to build Datadog monitor alerts based on p95 latency thresholds and error-rate log facets.

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Construct Datadog metric queries, log-to-metric conversions, and define multi-condition monitor thresholds.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Navigate to and click the specific files mentioned in the Task Objectives.
3. Make the necessary code edits in the editor.
4. Press `Ctrl + S` (Windows) or `Cmd + S` (Mac) to save your changes.
5. If you need to run commands, open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.

Validation

Once you have saved your files and are ready to submit, return to the platform dashboard and click the **"Submit Final"** button. This task is evaluated manually by the grading team.

Evaluation Rubric:

1. Building Datadog metric queries to calculate p95 latency percentile distributions: 4 marks
2. Creating custom log facets and log-to-metric aggregation rules: 3 marks
3. Configuring multi-condition monitor alert thresholds for API endpoints: 3 marks

Total Score: 10 Marks

Important Notes

- This is a manually evaluated question.
- Ensure all logs and configurations are fully saved in your workspace folder before submitting.
