

Basic Code Analysis: Automating Service Incident Escalations

Duration : 90 Min.

Scenario

You need to write a script that parses incident alerts from a log file, matches them to service owners via metadata records, and generates an escalation report file.

Target File Location & Creation

File to Create/Update: `student_workspace/escalate.py` **Input Resource File to Inspect:** `student_workspace/escalate.py`

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Complete the Python script '`escalate_incident.py`' to read alerts and write the report to '`escalation_report.json`'.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Open and inspect `escalate.py` inside `student_workspace/`.
3. Open `escalate.py` in `student_workspace/` and perform the required modifications.
4. Save your changes (`Ctrl + S` or `Cmd + S`).
5. Open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running `python run.py` locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Test Case	Requirement	Marks
TC1	<code>escalate_incident.py</code> is syntax-valid Python	3 Marks
TC2	Correctly parses alert status codes and log exceptions	3 Marks
TC3	Finds correct team mapping entries	3 Marks

TC4	Writes valid JSON output to escalation_report.json	3 Marks
TC5	Includes stack trace summary logs	2 Marks
TC6	Escalates high severity to immediate manager channel	2 Marks
TC7	Handles file read/write exceptions	2 Marks
TC8	Correctly formats escalation timestamps	2 Marks

Total Score: 20 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
