

Basic Code Analysis: Spotting Logical & Null Errors

Duration : 30 Min.

Scenario

An application is crashing with a Null Pointer / Undefined Exception when looking up non-existent user IDs. Create and implement a safe lookup module in student_workspace/.

Target File Location & Creation

File to Create/Update: student_workspace/user_lookup.js

Task Objectives

Perform the following actions inside the student_workspace directory: - Create a file named 'user_lookup.js' directly inside 'student_workspace/'. Implement the 'getEmail(user)' function ensuring it safely handles null/undefined user objects.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Open and inspect the scenario input files in student_workspace/.
3. Create/update the file student_workspace/user_lookup.js and populate it with valid parameters and configurations.
4. Save your changes (Ctrl + S or Cmd + S).
5. Open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your work by running python run.py in the terminal before submitting.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Your performance will be evaluated based on the following test cases:

Test Case	Requirement	Marks
TC1	user_lookup.js exists in student_workspace/ with valid JS code	3 Marks

TC2	Code handles non-existent/null user objects correctly	4 Marks
TC3	Function returns empty string or null instead of throwing error	3 Marks

Total Score: 10 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
