

Basic Code Analysis: Automating Service Incident Escalations

Duration : 90 Min.

Scenario

You need to write a script that parses incident alerts from a log file, matches them to service owners via metadata records, and generates an escalation report file.

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Complete the Python script 'escalate_incident.py' to read alerts and write the report to 'escalation_report.json'.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Navigate to and click the specific files mentioned in the Task Objectives.
3. Make the necessary code edits in the editor.
4. Press `Ctrl + S` (Windows) or `Cmd + S` (Mac) to save your changes.
5. If you need to run commands, open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running `python run.py` locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Your performance will be evaluated based on the following test cases:

Test Case	Requirement	Marks
TC1	escalate_incident.py is syntax-valid Python	3 Marks
TC2	Correctly parses alert status codes and log exceptions	3 Marks
TC3	Finds correct team mapping entries	3 Marks
TC4	Writes valid JSON output to escalation_report.json	3 Marks

TC5	Includes stack trace summary logs	2 Marks
TC6	Escalates high severity to immediate manager channel	2 Marks
TC7	Handles file read/write exceptions	2 Marks
TC8	Correctly formats escalation timestamps	2 Marks

Total Score: 20 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
