

Databricks Lab : Multitask Job Pipeline Setup

Duration : 60 Min.

Scenario

Build a multi-task workflow pipeline defining dependencies, failure retries, and task parameters.

Input Details

The environment has been pre-configured with the following resources: - **Workspace:** Pre-configured through KodeBuck Service credentials (DATABRICKS_HOST, DATABRICKS_TOKEN)

Username & Naming Conventions

Your candidate prefix is a combination of your username (the part of your email/login before the @ or _ symbol) and exam code. For example, if your username is student (or student_labskraft.com) and your exam code is exam123, your prefix is **student-exam123**.

You must name your resources accordingly:

- Multitask Job:** <prefix>-multitask-job (e.g. student-exam123-multitask-job)

Task Objectives

1. Create Workflow Job

- Set task sequence dependencies.
- Add task parameters.

Verification

Once you have performed the tasks, you can run the verification script to check your progress and receive your score. The verification system will check the actual resources in the environment.

Grading Criteria

Your performance will be evaluated based on the following test cases:

Test Case	Requirement	Marks
TC1	Job layout check	4 Marks
TC2	Upstream task dependencies definition	4 Marks

TC3	Parameter parsing validation	4 Marks
TC4	Task running sequences	4 Marks
TC5	Failure notification check	4 Marks

Total Score: 20 Marks

Important Notes

- Ensure all resource names contain your candidate username prefix in lowercase.
- Check that your script compiles cleanly and contains no syntax errors.
