

Log Analysis: Severity Filtering & Java Caused-By Stack Trace Triage

Duration : 30 Min.

Scenario

A Java microservice crashed with a cascading exception log. You must filter the logs by severity and locate the root-cause exception at the end of the 'Caused by' chain.

Target File Location & Creation

File to Create/Update: `student_workspace/solution.json` **Input Resource File to Inspect:** `student_workspace/app_trace.log`

Task Objectives

Perform the following actions inside the `student_workspace` directory: - Inspect `app_trace.log` in `student_workspace/`. - Edit `solution.json` and record the required log analytics or findings.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Open and inspect `app_trace.log` inside `student_workspace/`.
3. Open `solution.json` in `student_workspace/` and perform the required modifications.
4. Save your changes (Ctrl + S or Cmd + S).
5. Open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running `python run.py` locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Your performance will be evaluated based on the following test cases:

Test Case	Requirement	Marks
TC1	solution.json exists and is valid	3 Marks

TC2	Root cause exception class (NullPointerException/ConnectException) correctly identified	4 Marks
TC3	Originating line number correctly extracted from stack frame	3 Marks

Total Score: 10 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
