

Log Analysis: Enterprise KQL & Lucene Log Search Queries

Duration : 30 Min.

Scenario

You are building Kibana dashboard filters. Construct KQL queries to filter logs where HTTP status is 502 AND response time is greater than 2000ms.

Target File Location & Creation

File to Create/Update: student_workspace/solution.json **Input Resource File to Inspect:** student_workspace/kibana_discover.log

Task Objectives

Perform the following actions inside the student_workspace directory: - Inspect kibana_discover.log in student_workspace/. - Edit solution.json and record the required log analytics or findings.

Instructions to Perform the Task

1. When your workspace loads in **VS Code**, use the **Explorer** panel on the left to locate your files.
2. Open and inspect kibana_discover.log inside student_workspace/.
3. Open solution.json in student_workspace/ and perform the required modifications.
4. Save your changes (Ctrl + S or Cmd + S).
5. Open the built-in terminal by clicking **Terminal > New Terminal** from the top menu.
6. Verify your progress by running python run.py locally in the terminal.

Validation

Once you have saved your files and verified your progress, return to the platform dashboard and click the **"Run Test" / "Verify"** button. This will automatically evaluate your changes and generate your score!

Grading Criteria

Your performance will be evaluated based on the following test cases:

Test Case	Requirement	Marks
TC1	solution.json exists	3 Marks
TC2	KQL status code filter (status: 502) correctly constructed	4 Marks

TC3	Response time range condition (> 2000) included	3 Marks
-----	---	---------

Total Score: 10 Marks

Important Notes

- This is an auto-evaluated question. Ensure all code edits are properly saved and the 'run.py' checks pass before submission.
